- Data Understanding
- Data Preparation
- Modeling
- Evaluation
- Deployment.

# Project Overview

## Business Objective:

Make a suitable application where customer select a particular car with in a second application provide a price of that car.

## Hypothesis:

we will use the historical data of the **purani car dekho** and make a model for that company and attached to that application.

# Process Overview / Solution

# Data

- The number of records – **301**
- The number of columns – **8**
- The number of numerical columns – **4**
- The number of categorical columns – **4**

# Analysis

# Modeling

Here we can try to make a model having high accuracy.

So,

We trained Machine learning Model through

**Linear Regression**

**Random Forest** and also used **Random search CV**.

# Model Evaluation

Accuracy with different Algorithms in our Model are as follows:

<b>Linear Regression =</b>	<b>88%</b>	<b>89%</b>
<b>Random Forest =</b>	<b>98%</b>	<b>91%</b>
<b>Random Forest with Rcv=</b>	<b>91%</b>	<b>97%</b>

# Looking Ahead

Based on the analysis Random forest Regressor works perform on Data with accuracy 97%. More Test Data will be required to validate the robustness of the model.

More data Required: More Data = Better Model  
Try neural network to tune the model for better performance.
